

PUBLIC FACT SHEET

RABIES

What is rabies?

A viral infection that is usually fatal if not treated within 48 hours.

How is rabies spread?

Rabies may be spread through the following ways:

- From the saliva of an infected animal, through an open cut or scrape.
- Through organ transplant.

What are possible symptoms?

Symptoms may include:

- fever
- pain at the site of the bite
- swallowing difficulty
- restlessness or excitability
- muscle twitching
- convulsions
- numbness and tingling

How is rabies diagnosed?

From tests done on the infected animal or tests on the person.

What is the treatment for rabies?

- Clean the bite with soap and water.
- Immediately contact your doctor
- Rabies vaccine must be given within 2 days of a bite.

How can rabies be prevented?

- Avoid contact with unknown animals.
- Rabies vaccine.
